Effect of Equivalence Ratio and G-Loading on In-Situ Measurements of Chemiluminescence in An Ultra Compact Combustor

By Jason M. Armstrong

Biblioscholar Nov 2012, 2012. Taschenbuch. Book Condition: Neu. 246x189x7 mm. This item is printed on demand - Print on Demand Neuware - Using a spectrometer and high temperature fiber optics the relative intensities of the near-infrared, visible and ultraviolet radiation emitted from the C_2^* , CH^* , and OH^* radicals were measured at eight discrete locations within the Ultra Compact Combustor test rig. Blackbody radiation in the near infrared was also observed. The tests were conducted at various g-loadings and overall equivalence ratios and with various air hole configurations. These measurements were compared to determine the effect of these changes on the radiation emitted. Local C_2^* intensities were used to estimate the flame location within the combustor and the local CH^*/OH^* ratio was used as a gauge of the local equivalence ratio within the cavity. Results indicate the highest ratios of CH^*/OH^* occur in the outer radius of the cavity where the high g-loads transport the colder unreacted fuel and air. The highest C_2^* ratios also occur in the outer radius. A correlation between cavity equivalence ratio and C_2^*/OH^* was determined for these experiments as well. Fuel droplet size characterization was also conducted using a laser diffraction particle size analyzer. The...

Reviews

Without doubt, this is the very best job by any article writer. It typically does not cost too much. You are going to like just how the blogger write this pdf.

-- Jazmyn Beier II

This book can be worth a read through, and far better than other. It can be writter in easy phrases instead of confusing. You will not really feel monotony at at any moment of your respective time (that's what catalogs are for concerning if you check with me).

-- Wilber Altenwerth
